EXPERIMENT 10

Performance Optimization

Project: Insurance Claim Management using Low-Code in Zoho Creator

AIM

To improve the responsiveness and maintainability of the Insurance Claim Management application.

REQUIREMENTS

- Claims and policy forms with test records
- Reports and configured workflows
- Repeatable test scenarios

DESIGN / MODULES

Area	Optimization
Forms	Remove unnecessary fields and repeated calculations
Reports	Use relevant filters and display only needed columns
Workflows	Avoid duplicate triggers and repeated lookups
Data model	Use appropriate field types and relationships

PROCEDURE

1. Record the baseline behaviour of the claim form and reports using a fixed sample dataset.
2. Remove unused fields and unnecessary calculations where safe.
3. Filter reports by date, claim status, or policy type as appropriate.
4. Review workflows for duplicate notifications, repeated queries, and unnecessary loops.
5. Validate required fields and policy validity before accepting a claim.
6. Repeat the same tests and record measured results; do not claim speed gains without measurements.

SAMPLE LOGIC / OUTPUT

Record before/after observations for form response, report loading, workflow completion, and duplicate actions using the same test data.

TEST CASES

Test	Expected outcome
Open filtered claims report	Only matching claims are shown
Submit a valid claim	Record saves and workflow runs once
Submit incomplete claim	Validation prevents invalid submission

RESULT

Optimization steps and test cases are documented. Actual performance depends on the live application and record volume.
