EXPERIMENT 12

Security and Governance

Project: Insurance Claim Management using Low-Code in Zoho Creator

AIM

To apply basic security and governance practices to policyholder and claim information.

REQUIREMENTS

- Configured roles and permissions
- Sample policyholder and claim records
- Available audit/activity and recovery settings

DESIGN / MODULES

Control	Purpose
Least privilege	Give each role only necessary access
Input validation	Check required fields, dates, and claim amounts
Data minimization	Collect only necessary policyholder information
Audit review	Review available activity history
Recovery plan	Document backup and restoration procedures

PROCEDURE

1. Identify personal, policy, and claim information collected by the app.
2. Restrict access to policyholder details and claim reports by role.
3. Validate required fields, policy dates, claim amount, and document requirements.
4. Keep connection secrets and API tokens out of forms and shared documents.
5. Review available activity-history or audit capabilities and document their scope.
6. Document a recovery procedure suitable for the platform and test it safely where possible.

SAMPLE LOGIC / OUTPUT

Security checklist: roles tested; claim data restricted; required fields validated; secrets protected; activity review documented; recovery plan prepared.

TEST CASES

Test	Expected outcome
Policyholder views another person's claim	Blocked unless explicitly authorized
Claim amount is negative	Validation rejects it
Unauthorized user opens admin screen	Access denied

RESULT

A security and governance checklist is prepared. Verify platform-specific audit, backup, and recovery features in the live account.
