EXPERIMENT 13

Low-Code Limitations: Case Study

Project: Insurance Claim Management using Low-Code in Zoho Creator

AIM

To evaluate the benefits and limitations of low-code development for an Insurance Claim Management application.

REQUIREMENTS

• Claim-processing use case
• Core requirements and possible future requirements

DESIGN / MODULES

Requirement	Low-code fit / consideration
Claim submission forms	Good fit for structured data capture
Status notifications	Suitable for workflow automation when configured
Complex policy rules	May require custom functions and thorough testing
Document verification	May require OCR or external services
High-volume claim processing	Requires platform-limit and performance review

PROCEDURE

1. Define the claim workflow: submission, document check, review, decision, and status notification.
2. Map each requirement to Creator forms, reports, workflows, or custom functions.
3. Identify dependencies such as external APIs, OCR, platform limits, and permissions.
4. Assess risks including incomplete documents, incorrect policy links, unauthorized access, and duplicate claims.
5. Recommend controls such as validation, review queues, logs, and human review for exceptions.
6. Summarize which requirements fit low-code directly and which need additional engineering.

SAMPLE LOGIC / OUTPUT

Case-study summary: low-code accelerates forms and workflow automation; complex policy evaluation, document extraction, and large-scale processing need additional design and verification.

TEST CASES

Scenario	Discussion point
Required documents missing	Keep claim incomplete or route it for follow-up
External service unavailable	Record the failure and provide a safe retry or manual review
Complex policy rule	Validate with approved business rules and human review

RESULT

The case study identifies low-code strengths and areas requiring additional controls or specialist implementation.
